Ceramic Forming Tools for Tube Forming

Ceramic forming tools are characterized by their uniform grain-size distribution, optimum surface roughness, superior fracture toughness and low build-up for performance that improves dimensional accuracy and vastly extends service life.

The forces used in tube forming – such as drawing, bending or widening – also have an impact on the forming tools used and often push them to the limits of their performance capabilities. Tube forming tools made from the ceramic materials Zirconium oxide, Silicon nitride and – as a dispersion/composition – Alumina are extremely resistant to these mechanical and thermal stresses. CeramTec uses these materials to match the desired application and requirements placed on the tools. In addition, CeramTec also uses the ceramic material silicon nitride for joining and Pipe welding.

Ceramic Tools for Forming, Bending and Widening

- No cold welds
- High wear resistance
- High chemical and thermal resistance
- Improved surface quality
- Improved dimensional accuracy
- Vastly extended service life
- Customer-specific process optimization possible

The tribological properties of the surface qualities achieved with these ceramic materials guarantee that forming tools produced with the materials have an extremely long service life. The low diffusion and adhesion of the materials

prevents cold welds, and the hot hardness and temperature strength reduce the likelihood of plastic deformation. The chemical and thermal resistance of the forming tools also makes them suitable for use in aggressive environments, like molten metals, acids and lyes. The CeramTec forming experts at our Plochingen site will gladly provide you with advice on how to increase the performance of your forming tools with ceramics.

Zirconium Oxide, Alumina and Silicon Nitride are the advanced Ceramics used in the Forming Process

From the over 150 ceramic materials CeramTec has developed for specific applications, three types of advanced ceramics have proven themselves in the forming process in particular:

Zirconium oxide (ZrO_2) produces extremely strong and rigid components. Alongside its excellent tribological properties with respect to friction and wear on objects that move in opposite directions, its wear resistance, corrosion resistance and electrical and thermal insulation properties make CeramTec ZN40 zirconium oxide ceramic the ideal material for equipment and mechanical engineering. Zirconium oxide is gaining ground as a structural material for components subject to high stress.

[Zirconium Oxide](#) ZN40 in the Forming Process

- ZrO_2 ZN40 advanced ceramics
- Extraordinary fracture toughness
- High wear resistance
- High corrosion resistance
- Low thermal conductivity
- A coefficient of expansion similar to steel
- Ideally suited for copper and aluminum wire drawing

Alumina (Al_2O_3) is one of the most well-known oxide ceramic materials. CeramTec has developed a wide range of low-density and lightweight materials with a variety of property combinations. The CeramTec alumina ceramic B601 has proven itself in the forming process.

[Aluminum Oxide](#) B601 in the Forming Process

- Al_2O_3 B601 advanced ceramics
- High to extremely high mechanical strength
- Good thermal conductivity
- High corrosion and wear resistance
- Very good sliding properties
- Very good electrical insulation

Silicon nitride materials (Si_3N_4) are perfectly suited for manufacturing mechanically stressed components, even and especially at high temperatures. CeramTec SL200BG silicon nitride ceramics possess excellent characteristics for use in forming and are also employed in welding process applications.

[Silicon Nitride](#) SL200BG in the Forming Process

- Gas-pressure sintered Si_3N_4 SL200BG advanced ceramics
- High mechanical strength
- High fracture toughness and impact resistance
- Excellent wear resistance
- Good thermal conductivity
- Very low thermal expansion
- Thermal shock resistance
